LAB EXPERIMENTS

EXPERIMENT – 2

COMMON ELEMENTS BETWEEN TWO ARRAYS

AIM:

To find the common elements between two arrays and analyze their complexity.

ALGORITHM:

1. Start.
2. Initialize two arrays.
3. Create an empty list for common elements.
4. Traverse the first array.
5. Check whether each element exists in the second array.
6. Add matching elements to the result without duplicates.
7. Display the common elements and stop.

PROCEDURE:

1. Declare two arrays containing integer values.
2. Initialize an empty list named common.
3. Check each element of the first array against the second array.
4. If the element exists in both arrays and is not already in common, append it.
5. Print the final list of common elements.

PYTHON CODE:

```python
arr1 = [1, 2, 3, 4, 5]
arr2 = [3, 4, 5, 6, 7]
common = []
for x in arr1:
    if x in arr2 and x not in common:
        common.append(x)
print("Common elements:", common)
```

SAMPLE OUTPUT:

```
Output

Common elements: [3, 4, 5]
```

RESULT:

The first palindromic string, level, was found successfully.
